#### [GNB Updates](#)

Public Health reported one new case of COVID-19 on May 5, the first in New Brunswick since April 18.

The new case is an individual aged 30-39 in Zone 3 (Fredericton region) and the means of transmission is under investigation.

To date, there have been 119 confirmed cases in New Brunswick. The other 118 people have since recovered from their illness.

Dr. Jennifer Russell, chief medical officer of health, said the emergence of a new case was expected, given the prevalence of the virus in neighbouring provinces and states.

"This is part of our new normal," said Dr. Russell. "New cases will appear and, when they do, we will take the necessary steps to isolate them and track down those they have been in contact with."

Dr. Russell urged New Brunswickers to continue taking actions to slow the spread of the virus, including physical distancing, wearing a community face mask, maintaining appropriate hygiene practices and getting tested if they have symptoms.

#### **New case is not connected to WestJet flight to Moncton**

Public Health received word on May 4 that a person confirmed to have COVID-19 was a passenger on WestJet flight 3456 to Moncton on April 27.

Dr. Russell said the person was not tested in New Brunswick and that this case is separate from the new one announced today.

"We have determined that the person in question landed in Moncton and, while we believe the person is not in New Brunswick, we are confirming with another jurisdiction the person's whereabouts," said Dr. Russell.

Dr. Russell said any person who travelled on this flight is directed to self-isolate for 14 days and to contact Tele-Care 811 or their primary health-care provider if symptoms of COVID-19 emerge.
